8. The Soviets undoubtedly would be able to pick up anything else they required in Europe, as there were at least a dozen different large-scale manufacturers of welding equipment in Western Europe before World War II.

visited by a number of Soviet engineers and inspectors and we found them invariably to be smart and well trained in the field of welding. They were extremely fussy about the noise and the balance of the induction motors, which ranged from 1/2 h p to 30 h p. Several of the Soviet inspectors told us that the reason they were so fussy was that while they realized that the noise would not affect the performance of the equipment, it might be considered substandard by other Soviet officials who were not technically trained and they would be shipped off to Siberia for failure to catch non-existent defects in the meters.
